You have a linked list and want to find the k th to last node.

Write a function `kth_to_last_node()` that takes an integer k and the `head_node` of a singly-linked list, and returns the k th to last node in the list.

For example:

```
class LinkedListNode:
```

Python 3.6 ▼

```
    def __init__(self, value):
        self.value = value
        self.next = None
```

```
a = LinkedListNode("Angel Food")
b = LinkedListNode("Bundt")
c = LinkedListNode("Cheese")
d = LinkedListNode("Devil's Food")
e = LinkedListNode("Eccles")
```

```
a.next = b
b.next = c
c.next = d
d.next = e
```

```
# Returns the node with value "Devil's Food" (the 2nd to last node)
kth_to_last_node(2, a)
```
