Q.1

$0 \leq l \leq r < n$

indexing
is 0 based

You're given a list of numbers which are initially all zeros. This list can be of

Size N . then you will be given ' Q ' queries

$n \leq 10^6$ where in each query you have 2 no. ' L ' and

$Q \leq 10^6$ ' R '. Your task is to increment all the no.

from position ' L ' to ' R ' by 1 . finally print the
updated & final list.

inclusive

^{0 1 2 3 4}
[0, 0, 0, 0, 0]

$n = 5$

① [0, 1, 1, 1, 0]

$q = 3$

② [0, 1, 2, 1, 0]

③ [0, 2, 3, 2, 1]

→

①

L

1

R

3

②

2

2

③

1

4

final list

ans → [0, 2, 3, 2, 1]

$$a) 10^{1000}$$

$$b) 10^{100}$$

$$c) 10^{10}$$

$$d) 10^8$$

$$e) 10^5$$

Brute force

Accurate

Efficient

for each query, start from index 1 & go till index R & increment everything by 1

$$q \leq 10^6$$

~~$q = 10^6$~~

$n = 10^6$

$l = 0$ $R = n - 1$

$$10^6 \times 10^6 > 10^8$$

1 sec $\rightarrow 10^8$
1 $\rightarrow \frac{1}{10^8}$
 10^{12} \rightarrow 10⁴ sec

$q = 3$

$\rightarrow \underline{\underline{arr[l] += 1}}$

$\rightarrow \underline{\underline{arr[r+1] -= 1}}$

$\underline{\underline{[r+1 < n]}}$

0, 2, 3, 2, 1

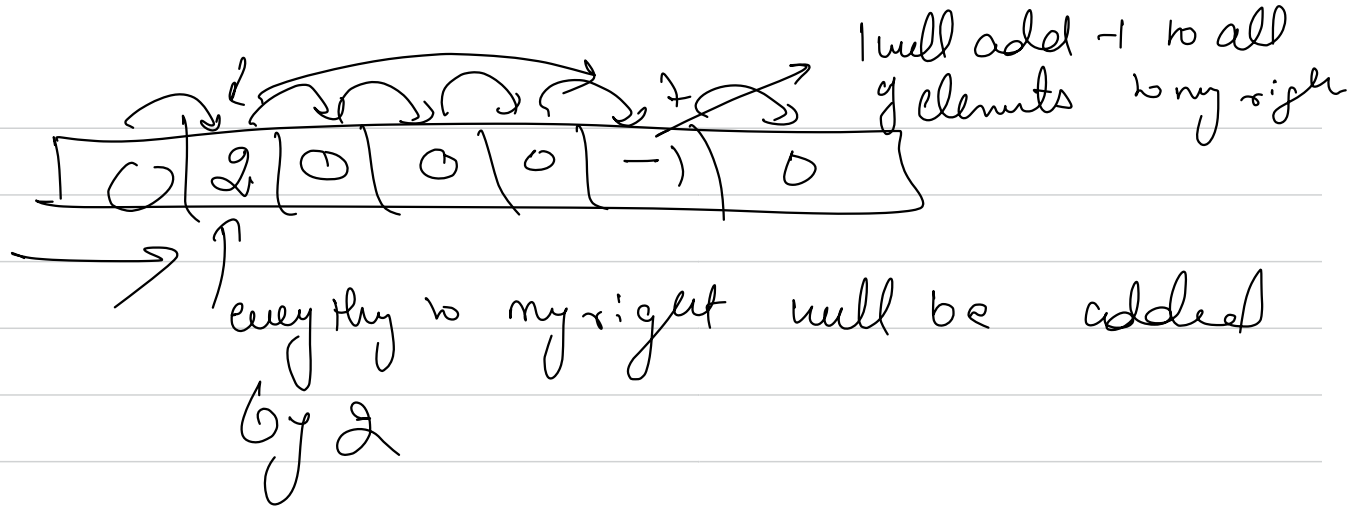

We know at least we have to read all queries.

Think about Scenery so that we don't have

to process them as soon as we read mem.

prefix sum

cumulative sum from l to r

Resulting array: $[0, 2, 2, 2, 2, 1, \underline{\underline{1}}]$

a) $q \times n$

b) $q + n$

c) $n + \log q$

d) $\log n + q$

a) q

b) n

c) no thing ✓

d) $q \times n$

e) $q + n$
